## Sack Handling

### Sack Handling

Our range of sack tipping stations provide a safe, dust free method of manually emptying bags and sacks containing powders and granules.

Systems typically include:

- **Dust extraction using reverse jet dust filters with fan - this provides a through draught of air, ensuring any dust from the sack is drawn up into the sack tip unit and away from the operators face.**
- **Level probes for contents control and impact vibrators, aeration and stirrers for clean discharge.**
- **Dosing and feeding devices Weighing systems and controllers**
